County Population Projections with Race/Ethnic Detail
Estimated July 1, 1990-1996 and Projections for 1997 through 2040

ACKNOWLEDGMENTS

This report was prepared by **Mary Heim** under the general direction of **Linda Gage**, Chief, Demographic Research Unit.

The population projections are produced through the efforts of the entire Demographic Research Unit. **Linda von Rotz** developed the special populations. **John Malson** and **Paula Flores** were responsible for migration analysis. **Carol Corcoran** and **Judi McClellan** developed historical fertility rates and made recommendations about assumptions. **Andrew Ruppenstein** developed the mortality rates. **Richard Lovelady** and **Julie Hoang** are responsible for the reports. **Dolores Lykins** provided administration support. **Melanie Martindale** and **Dan Sheya** also contributed to the report.

SUGGESTED CITATION

State of California, Department of Finance, *County Population Projections with Race/Ethnic Detail*.
Sacramento, California, December 1998.

These population projections were prepared under the mandate of Government Code, Sections 13073 and 13073.5. In addition, the State Administrative Manual, Section 1100 on state plans, sets the general policy of . . ."3) The use of the same population projections and demographic data that is provided by the State's Demographic Research Unit."

TECHNICAL NOTES

The Department of Finance uses a baseline cohort-component method to project population by gender, race/ethnicity and age. For the purposes of this projection, the five race/ethnic categories are mutually exclusive. A baseline projection assumes people have the right to migrate where they choose and no major natural catastrophes or war will befall the state or the nation. A cohort-component method traces people born in a given year through their lives. As each year passes, cohorts change due to the mortality and migration assumptions. New cohorts are formed by applying the fertility assumptions to the women of childbearing age.

Special Populations

The primary sources of special populations are prisons, colleges, and military installations. Special

populations display very different demographic characteristics and behavior. In counties where special populations represented a significant proportion of the total population, they were removed from the base and projected separately. For prison and military populations, the determination was made based on an examination of sex ratios and, to a lesser extent, the age structure. College adjustments were based on an examination of age structure.

Forecasts from the Department of Corrections were used to determine the timing and capacity of new facilities. Information from individual military bases as well as the Pentagon was used to project the population effects of base closures and realignments. In most other instances, the special populations were held at the 1990 level.

Survival, Fertility and Migration Proportions

Life tables were developed using deaths from the Department of Health Services by gender, race/ethnicity and age for 1970, 1980, and 1990.

Age-specific, general, and period fertility rates were developed by race/ethnicity and by county for 1970, 1980, and 1990. Births to women under 15 and over 44 were added to the births of the youngest and oldest age groups when computing the fertility rates. For instance, a birth to a 46-year-old woman would be included in the calculation of the 40-44 age-specific fertility rate.

Migration proportions were developed for the two decades between 1970 and 1990 by a survived population method. The 1970 population was aged forward in time to 1980 by adding recorded births to form new cohorts and subtracting deaths from existing cohorts. The survived population was compared to the 1980 population and differences were assumed to be migration. The ten-year migration was annualized and divided by the total to derive a proportion. The same process was used for the period 1980 to 1990. The migration proportions for the two decades were then averaged and smoothed using a five-year moving average.

Assumptions

Base Population: As the benchmark (or starting population), the Department of Finance has used the 1990 Census counts as modified by the Bureau of the Census for known misreporting. These counts represent a modification to the age distribution of the census count and not an adjustment for undercount to the total. This is consistent with the population which is being used by the Census Bureau for current estimates as well as the national projections. The census population was moved forward from April 1 to mid-year. The Department of Finance further refines this base population for special populations as discussed earlier.

Fertility: Between 1950 and 1980, the fertility rates of California and the nation did merge; however, a sharp divergence began during the 1980s. While the nation's fertility rates were flat, fertility rates in California rose sharply. The majority of this divergence is due to California's greater race/ethnic diversity and the fertility differences among these groups.

Between 1970 and 1990, total fertility rates for counties in California did not merge toward a national or state norm. However, when the analysis was carried out for race/ethnic groups, a different pattern emerged. Between 1970 and 1990, county total fertility rates by race/ethnic group did merge toward the statewide norms.

The projections assume that each county's race/ethnic-specific and age-specific fertility rates merge toward a state forecast of fertility rates by age and race/ethnic group. County differences from the state norm decline to one-half the current level in 100 years because of the long-term trend of California becoming more like the nation.

Mortality: Evaluation of the life tables by county, gender, and race/ethnic group revealed that the county tables contained many small data cells which could not deliver consistent results. Therefore, statewide survival rates by gender and race/ethnic group were used for all counties in California. On a statewide basis, life expectancy and survival rates increased more slowly between 1980 and 1990 than between 1970 and 1980. Mortality rates for the initial year 1990 were calculated using deaths for 1989-1991 and the adjusted census population. These central death rates were converted into probabilities of surviving. Because of the resulting random fluctuations caused by small numbers, these probabilities were smoothed from age eight upwards using a three-year moving average. The Census Bureau's national age, sex and race/ethnic-specific mortality schedules from the middle series (adjusted slightly) were used as an end point, and the interim years, 1991-2040, were interpolated.

Migration: Migration is the most volatile of the components of population change. Since 1970, annual migration has fluctuated from -82,000 to +421,000. For the future, the Department relies most heavily on long-term averages of total net migration. The age, sex and race/ethnic distribution of migrants is based on an analysis of the 1970, 1980 and 1990 censuses and the implied migration distribution by age and sex. The derived migration distributions for the two decades were averaged and smoothed.

The Department of Finance expects total net migration in the period between 1997 and 2003 to rebound from the historically low level of the mid 1990s and to average more than 250,000 per year. This is consistent with recent short-term forecasts. Following this pent-up demand, migration will slowly decline to about 180,000 after the year 2015. This represents a return to a long-term historical annual average, modified by county-specific migration assumptions made in consultation with local government planners and demographers whenever possible. When local input was not available, the migration assumptions were made by the Department of Finance based on historical analysis.

Demographic Model

The base benchmark population was projected using the final assumptions—i.e., local age and race/ethnic fertility will merge toward state norms, life expectancy will follow national trends, and there will be an annual average net in-migration to California of 203,000 throughout the forecast period. New cohorts are created by applying the fertility assumptions to the women of childbearing ages. The population ages with time, as the gender, race/ethnic, age-specific survival rates are applied to the population at risk. In addition, the overall migration assumption is distributed using the assumed gender, race/ethnic, and age proportions. The process is carried forward for 50 years from 1990. Special populations are then added to produce total population projections. For the period 1991 and 1992, the populations are benchmarked to the Department's 1997 E-2 Report.

These population projections depict only one possible course of future population change, i.e., the one reflecting recent trends in fertility, mortality, and migration. These projections do not necessarily show what is most desirable but rather what can be reasonably expected if current trends continue until the year 2040.
